Patent No. 6551795
GENERAL INFORMATION:
ADPLICATION
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

Fucus vanadium bromoperoxidase polypeptide and coding sequence, useful for halogenating or oxidizing compounds, e.g. as antibacterial agents.

Š

ò g ò 음 ò 셤 à

Claim 3; Page 36-41; 46pp; English

This sequence represents cDNA encoding a vanadium bromoperoxidase from species of Fucus. This enzyme is 73.4 kD in mass and catalyses the coxidation of o-dianisadine (ODA) when complexed with a vanadium ion. The cDNA encoding the enzyme was isolated from a Fucus 2-cell embryo cDNA library using hybridisation probes (AAA10306-A10307) corresponding to the second and third regions that are conserved between Curvularia and Ascophyllum vanadium haloperoxidase active sites. Fucus vanadium bromoperoxidase cDNAs (one full-length, two 5'- truncated) were then cloned into the pET LIC (ligation independent cloning) vector for correct folding. The Fucus vanadium bromoperoxidase proteins were expressed fused to an N-terminal thioredoxin tag which optimises correct folding. The Fucus vanadium bromoperoxidase has a specific activity several-fold higher than other algal vanadium haloperoxidases for which at least partial sequences have been reported. Vanadium chaloperoxidases can be used in a method for enzymatically halogenating a compound. They can be used in a method for enzymatically oxidising a compound. They can be used to produce epoxides from alkenes including proteins. They can be used to produce epoxides from alkenes and alkymes. Vanadium alkymes, to produce alpha, gamma-halohydrins from cyclopropanes, and to produce alpha, gamma-halohydrins from cyclopropanes, making then useful in signal generating systems in place of horseradish chem useful in signal generating systems in place of horseradish agents and in the production of phenolic adhesives

The invention relates to nucleic acid encoding vanadium haloperoxidase particularly vanadium bromoperoxidase polypeptide which consists of a catalytic helical frame that complexes a vanadium ion and catalyses the oxidation of o-dianisidine (ODA). The invention also provides combinantly produced vanadium haloperoxidases. The polypeptides of the invention can be fused to other proteins to allow quantification or localisation of the linked protein. They can be used to halogenate various substrates including proteins; to produce appoints from alkenes, halogenated ketones from alkynes; to produce alpha, gamma-halohydrins from cyclopropanes and to produce dihalogenated products from alkenes and also be used in signal generating systems in place of norseradish peroxidase; as a component in assays; as enzymatic altimicrobial agents; and in the production of phenolic adhesives. The polypeptides can be used in industrial catalysis in a variety of contexts, eg catalyst for halogenation, and epoxidation reactions. The present sequence is Rucus distiches vanadium reactions. The present sequence is Rucus distiches vanadium creations contexts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100

The vanadium haloperoxidase, especially vanadium bromoperoxidase (VBPO) cDNA. The vanadium haloperoxidase, especially analytical systems; and as anti-microbial agents. The VBPO is also useful for industrial applications. The VBPO is also useful for detecting a wide variety of chemical and biological materials such as amino acids, peptides, polypeptides, proteins including enzymes, avidin, antibodies and antigemic proteins including enzymes, avidin, antibodies polysaccharides and lipopolysaccharides, hormones such as human chorionic gonadorropin, thyroid stimulating hormone, luternising hormone, thyroxine, follicle stimulating hormone, parathyroid hormone, hormone, metabolites such as glucose, lactate and pyruvate, oligonucleotides, nucleic acids, vitamins such as Bl2 and biotin, intact cells from various organisms including microorganisms and drugs such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   87
                                                                                                              This cDNA encodes a haloperoxidase enzyme. The haloperoxidase genes encoding the enzymes CP.BP01 and CP.BP02 are isolated from Corallina pilulifera. A host cell transformed with a vector containing the haloperoxidase genes can be used for the recombinant production of the enzyme. The haloperoxidases of the invention are vanadium-dependent and have halide specificity of bromine and iodine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin invention allow direct manipulation of dorrigocin, lactimidomycin involved in the biosynthesis of dorrigocin and ractimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaccus DORR ORF5 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated or purified polypeptide involved in biosynthesis of polyketide dorrigocin or polyketide lactimidomycin, useful for preparing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AlaalaaspIhrThrargGly---SerProMetPro-AspThrGlyValLeuArgleule 23

```
The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaceus DORR DNA
                                                               Novel isolated or purified polypeptide involved in biosynthesis of polyketide dorrigocin or polyketide lactimidomycin, useful for preparing dorrigocin or lactimidomycin.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid childible by the nucleic acid (2) a host cell containing the vector; (3) an isolated concluded a polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a computed; a culture comprising strains in which the test compound that inhibits proliferation of the strains is activity; (1) a culture comprising strains in which the test compound that inhibits proliferation of corganism acts; (9) manufacturing an antibiotic; (10) profiling a compound; as activity; (11) a culture comprising strains in which the care or the respect of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. prokaryotic essential genes. Note: The sequence is one of the target provaryotic essential genes. Note: The sequence is one of the target for the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -----SerAspAspAlaLeuAspProThrAlaProAsnArgArgAspAsnValAlaPh 146

This sequence represents a 68.75 kb contig from Sorangium cellulosum comprising 22 open reading frames (ORFs) and includes genes encoding proteins involved in the biosynthesis of epothilones. Epothilones A and B are lemembered macrocyclic polyketides with an acylorgateine-derived starter unit; polyketides being synthesised from two-carbon building blocks, the beta-carbon of which always carries a keto group. Each round of two-carbon addition is carried out by a complex of enzymes known as the polyketide synthase in a manner similar to fatty acid biosynthesis. EPOS A (AAYS8573) and EPOS P (AAYS8574) are involved in formation of the thiazole ring formation of epothilones, and EPOS B, EPOS C, EPOS D and EPOS B (AAYS8579) is an epothilone macrolactone oxidase, and the proteins or 3 (AAYS8579) is an epothilone macrolactone oxidase, and the proteins or 3 (AAYS8579) is an epothilone macrolactone oxidase, and the proteins or 3 (AAYS8579) is an epothilone macrolactone oxidase, and the proteins or 3 (AAYS8579) is an epothilone macrolactone oxidase, and the proteins or substituted for taxol in cancer chemotherapeutic compositions.

Epothilones exhibit a much lower drop in potency against a multiply drugginatesitate cell line compared with taxol, and are considerably less efficiently exported from such cells by the multidrug resistance protein (MDR, or P-glycoprotein). Despite the potential of epothilones as anticancer agents, they are problematical to produce on a large scale.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            51516 AGTGACACCTGGCTGTGGGACGCCGCTGGACGGTGGACGCCCAGAGCGCGGAGCGTG 51575

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Epochilones are too complex for industrial scale chemical synthesis, and Sorangium cellulosum is difficult to ferment, producing poor yields of epochilones. The nucleic acids of the invention may be used for the recombinant production of epochilones in a heterologous host that is more amenable to fermentation. (Updated on 15-SEP-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -------LysLysValLysLeu 66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ProThrAspGlyIleSerAlaSerLysIleLeuGlyLysIleMetAlaArgValArgIle

         genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes

The invention relates to purified/isolated polypeptides involved in synthesis of the warhead structure in enediyne compounds, or their fragments or sequences 75% homologous to them. The polypeptides comprise five families of proteins: PKDE (polyketide synthase), TEBC (thicesterase enediyne biosynthetic loci), UNBL, UNBV and UNBU (unique to enediyne biosynthetic loci), The proteins are isolated from 10 different micro-organisms. Also included are the nucleic acids encoding the proteins, antibodies specifically binding the polypeptides, and a computer system/computer readable medium comprising the sequences referred to above. The polypeptides and polynucleotides are useful in genetic engineering to design new enediyne biosynthetic loci. They can also be used to identify enediyne biosynthesis genes/gene fragments from also be used to identify enediyne biosynthesis genes/gene fragments from samples containing genomic DNA e.g. in biomass from an environmental cultures or genomic libraries obtained from a mixed population of organisms), pure cultures or genomic libraries obtained from a mixed population of organisms or from pure culture. The present sequence encodes an enzyme of the enediyne warhead structure biosynthetic pathway
                                                                                                                                                                                                                                                                                            New enediyne polyketide synthase polypeptides involved in synthesis of
the warhead structure in enediyne compounds useful in design of new
enediyne compounds and identification of new enediyne biosynthetic loci.
                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Page 183-186; 310pp; English

This invention describes novel DNA sequences (I) for specific detection of Pseudomonas putida KT2440. The invention also describes (1) crecombinant expression vector containing (I); (2) prokaryotic or eukaryotic cells transformed or transfected with (I) or the vector of (1) (2); (3) production of expression products by culturing cells of (2); (4) expression products, or their fragments, of (I) and synthetic proteins or ceptides with the same sequences (A); (5) poly- or mono-clonal antibodies (Ab) that react specifically with (A); (6) hybridoma cells that produce the monoclonal Ab of (5); (7) transgenic plants that contain transformed or transfected cells of (2); (8) detecting KT2440 using a labeled (I) or Ab as probe; and (9) DNA chips carrying one or more (I). (I), and their fragments, are used as probes to detect and isolate full-length cDNAs and/or to amplify such cDNAs by polymerase chain reaction, and for production of transgenic plants. (I), or antibodies that recognize their expression products, are used for detecting the presence of KT2440, particularly in presence of other, even closely related, bacteria. KT2440 creamed the for genetic engineering work, e.g. as microbial production carains, for biological remediation and as vaccine carriers. (I) are because the contain the sequence in other contains, for biological remediation and as vaccine carriers (I) are contains, for particularly the negation of the bacteria and significant homology with sequences in other contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      843
